Prerequisites: ECON1001/1210 Introductory microeconomics and ECON1002/1220 Introductory macroeconomics according to the Regulations, Syllabus & Structure and List of Courses for the BEcon and BEcon&Fin programmes.

The course is primarily for students majoring in economics and as such can be technical at times, involving the use of mathematics including elementary calculus.

Textbook: Macroeconomics by Andrew B. Abel, Ben S. Bernanke, and Dean Croushore, 8th edition, Pearson Addison Wesley.
Assessment:
Homework    20%
Test        20%
Examination 60%

Course Description:

Theories of income, employment, and the price level; analysis of secular growth and business fluctuations; introduction to monetary and fiscal policy.

This course is macroeconomics—the study of the entire economy as opposed to individual markets—at an intermediate level. Questions include but are not limited to: What drives long-run economic growth? What causes short-run fluctuations in income and output? How do government policies affect aggregate output, unemployment, and inflation? A variety of models are developed in macroeconomics to analyze such questions. This course introduces students to the basic models for the major macroeconomic questions.

While the topics covered are similar to topics covered in Introductory Macroeconomics, the approach in this class would be quite different to the extent that the theory examined would be firmly grounded on rigorous economic principles as far as possible, an approach that is known as the microeconomic foundation of macroeconomics.

Course Objectives:
1. To provide a simple yet rigorous framework to understand real world macroeconomic events.
2. To avoid the fallacies and mistakes often made in the popular press and by your favorite investment gurus on the causes and consequences of long-run growth and short-run fluctuations.
3. To prepare students for more advanced studies in macroeconomics.
